

Since 2022, scholarly observations, studies, and trials have explored several novel uses and treatments involving basil (*Ocimum basilicum*), with some demonstrating particularly promising results:

Studies with Extraordinary Promise

• Neuroprotection and Memory Enhancement:

◦ A study conducted from late 2022 to early 2023 investigated the neuroprotective action of *Ocimum basilicum* L. var. thyrsiflora leaf extract¹. It demonstrated that a lower dose (200 mg/kg) of the extract significantly reversed scopolamine-induced non-spatial memory deficits in rats, showing effects similar to the positive control, piracetam¹². The extract also alleviated the scopolamine-induced increase in mRNA expressions of genes (NA7, M1, nNOS, HTR3A) implicated in cognition and neuroprotection, suggesting its potential to prevent memory impairment by altering gene expression related to memory processes and neuroprotection¹². This research contributes significantly to the understanding of basil's role in cognitive health².

• Antiviral against Japanese Encephalitis Virus (JEV):

◦ Research posted in August 2024 (with underlying work from inferred 2022-2023) conducted a comprehensive *in silico* and *in vitro* screening of *Ocimum basilicum* phytoconstituents against the JEV envelope (E) protein³. Chicoric acid (CA), rutin, and salvianolic acid A (SA) from basil exhibited outstanding docking scores, outperforming the reference drug mycophenolate³. Molecular dynamics simulations showed that CA and rutin maintained strong stability on the protein's binding pocket and had lower free binding energy³. An *in vitro* study further supported the antiviral potential of CA and rutin at the early stage of the virus's lifecycle, highlighting their therapeutic potential as novel anti-JEV agents³⁴.

• Anti-Toxoplasmosis in Diabetic and Hypertensive Mice:

◦ A study published in August 2024 assessed the prophylactic and therapeutic effects of basil on toxoplasmosis in diabetic and hypertensive mice⁵. All treated groups showed a statistically significant reduction in median tissue cyst counts compared to infected control groups⁵. Notably, combined therapy with basil and spiramycin resulted in the highest reduction rates (60.5%) of *T. gondii* cysts in both hypertensive and diabetic mice⁵⁶. Histopathological assessments revealed moderate to marked improvement of brain, spleen, and kidney inflammation in all treated groups, especially with the combined therapy⁵. The study highlights basil's promising antiparasitic effect and is noted as the first to assess these effects in hypertensive mice⁵⁷.

• Anti-Oral Cancer (*in vitro*):

◦ Published in June 2024, a study investigated the impact of ethanolic basil leaf extract on Ca9-22 oral cancer cells⁸. The findings demonstrated that the extract exerts potent cytotoxic effects by inhibiting key regulators of cell proliferation and inflammation⁹. It effectively suppressed the expression of inflammatory mediators such as COX-2, iNOS, TNF-α, IL-1β, and IL-6¹⁰. This research suggests that basil extract holds promise as a novel therapeutic option against oral cancer and warrants further investigation¹¹.

• Anti-Cervical Cancer (HPV-positive) with Immunomodulatory Effects (*in vitro*):

◦ A 2025 study explored the potential of medicinal plant extracts, including *Ocimum basilicum* (basil), as alternatives to conventional chemotherapy for HPV-positive cervical cancer¹². The basil extract (OBE) showed cytotoxic effects against cancer cells while having limited impact on normal cells, indicating a favorable safety profile¹³. Importantly, OBE also exhibited immunomodulatory properties, specifically an increase in Interferon-gamma (IFNG) production, which suggests it may support immune responses against cancer¹³.

• Multi-target Efficacy of Basil Seed Essential Oil:

◦ A 2023 study reported the first comprehensive biological investigations of essential oil extracted from Palestinian *Ocimum basilicum* seeds¹⁴¹⁵. The essential oil demonstrated potent antioxidant, anti-α-glucosidase (antidiabetic), anti-obesity, and antimicrobial effects against gram-positive and gram-negative bacteria, as well as *Candida albicans* fungus¹⁵¹⁶. It also showed potential cytotoxic activity against MCF-7 and Hep3B cancer cell lines¹⁵. This broad range of activities from the seed essential oil positions it as a significant source of natural agents for various health applications¹⁵.

• Significant Hypoglycemic and Antioxidant Effects in Rats:

◦ A study published in 2025 investigated the therapeutic potential of basil (*Ocimum basilicum* L.) aqueous extract on glycemia and oxidative stress in normoglycemic and diabetic rats¹⁷. The findings revealed a significant hypoglycemic effect in both healthy and diabetic animals, along with a decrease in lipid peroxidation and an increase in the activity of antioxidant enzymes¹⁸. Furthermore, when combined with monacetoholic acid (MKC), the basil extract demonstrated enhanced hypoglycemic and antioxidant effects, as well as regenerative effects on pancreatic Langerhans islets in alloxan-induced damage, highlighting its synergistic potential for metabolic disorders¹⁹.

Other Novel Uses and Treatments

• Antimicrobial for Urinary Tract Infections (UTIs):

◦ A 2023 study determined the inhibitory activity of ethanolic extracts from *Ocimum basilicum* seeds against bacteria causing urinary tract infections²⁰. The ethanolic extract proved significantly effective, more so than the hexane extract, with higher concentrations (100% and 75%) yielding greater inhibition rates against both gram-positive and gram-negative bacterial strains²⁰.

• *In silico* Anti-aging Skin Agent:

◦ Research from 2023 explored the potential of basil's chemical compounds as an *in silico* anti-aging skin agent²¹. Five specific compounds (ladanein, acacetin, luteolin, 5-hydroxy-7,4'-dimethoxyflavone, and genkwanin) were predicted to exhibit anti-aging properties by demonstrating strong binding affinity to Matrix metalloproteinase 1 (MMP1), a protein related to skin aging²¹²².
